Title: Senior Software Engineer

Location: Pune, India

Experience Summary

- Working as a skilled Java-Kafka developer on the BSP(Barclays Streaming Project) project within Barclays Account, leveraging my one year experience in designing, implementing, and working on a data streaming application.
- Thorough understanding of Kafka elements, structures and fundamental concepts.
- Performed code and unit testing for modules of the project.
- Trained in Kafka, JEE with Mulesoft and having knowledge of Spring Boot and Oracle.
- Good understanding of Programming languages with Data Structures – C++, Java, Development & Build Tools(Maven), DevOps(GitHub, CI with Jenkins, SonarQube), JPA with Hibernate 3.0, Spring REST and Docker.
- Constructed a Spring boot application that integrates with Zuul proxy to route the REST endpoints.
- Developed Microservices Application such as Flight Management System by using Spring Boot, Java, Oracle and integrated in MuleSoft.
- Developed Microservices Application such as Wikimedia Stream To Database by using messaging system as Apache Kafka and implemented the producer – consumer application using Spring Boot, Java and store the real-time data into Postgre Database.
- Experience of working in teams in technical projects during training.
- Excellent interpersonal skills to facilitate effective business communication.

KEY SKILLS:

Tools	Kafka, MuleSoft, GIT, Development & Build Tools(Maven), DevOps(GitHub, CI with Jenkins, SonarQube), Postman, Swagger
Languages	C, C++, JAVA, SQL
Databases	Oracle (SQL), PostgreSQL, MySQL, H2 Database
Methodologies & Frameworks	OOPS, JPA with Hibernate 3.0 (Basics), Spring 4.0 with Spring Boot, Spring with REST, Microservices using Spring REST, Junit, Agile
Platforms	AWS, Docker
Applications/IDE	Eclipse, Spring Tool Suite(STS), IntelliJ, Anypoint Platform, Anypoint Studio
API Gateway	Zuul Proxy

Professional Experience

01 Project:	Barclays Streaming Platform(BSP)
Project Description:	The highly scalable streaming platform that implements various Kafka components and perform operations for coordinating between producer and consumer. It is a centralized managed service with real time use cases spanning multi-cloud environments. The platform helps by assisting tenants, ensuring a seamless data streaming experience.
Role:	Java-Kafka Developer
Tools & Technology:	Apache Kafka, Java, Junit, Git, Docker, Prometheus, Grafana, Bitbucket, IntelliJ.
Project Duration:	1 year
Responsibilities:	- Involved specifically in one of the library on BSP project where I've designed starter template classes for producers and consumers providing specified configurations that simplify data streaming for tenants. - Writing Junit test cases for different classes using Embedded Kafka for setting up a Kafka environment within test cases. - Responsible for provisioning support for servers across various environments. - Configured Custom environments to support tenants as per their needs. - Offering support to other classes and their methods within the project. - Foundational knowledge of Docker. - Introduced Topic level monitoring in Kafka using Prometheus and Grafana. By employing Prometheus JMX Java agent, gathered metrics and created a Grafana dashboard for analysis and visualization. - Writing a Java-Kafka based application for handling continuous flow of data. - Writing a Spring Boot Java application and added filters by integrating API gateway i.e. Zuul Proxy. - Successfully contributed to the project by working with various Kafka components, such as producers, consumers, brokers, and topics.

Project Summary

Project:	Flight Management System (Part of the L1 training at Capgemini)
Project Description:	The Flight Management System is a Java-based application used for booking flight tickets . It is developed as REST API web service using STS, synchronized using Git, integrated using Anypoint Studio, deployed on CloudHub, published as a public asset on AnyPoint Exchange. It combines information offered by many airlines and thus gives the user details and pricing in real-time. They can easily book, cancel, view, and change their bookings using this application.

Role: Team Member

Tools & Technology: Spring Tool Suite, Anypoint Studio, Postman, Java, Spring Boot, JPA with Hibernate, H2 Database, MuleSoft

Project Duration: 3 Months

Responsibilities:

- Create RAML specification for Scheduling Flights microservices.
- Writing backend code in JAVA.
- Configuring database and writing queries to perform CRUD operations.
- Writing the admin side components for Scheduling Flights.
- Writing the functionalities like adding a Scheduled Flight for an existing Flight, modifying the details of Scheduled Flight, view Scheduled Flights between two Airports on a particular Date etc.

Training

Trainings
JEE With MuleSoft from Capgemini Pvt. limited
Kafka Training from Capgemini Pvt. limited

Certifications

Certifications	Score
MuleSoft Certified Developer Level - 1	Passed
AWS Cloud Practitioner	Passed
Microsoft Certified: Azure Fundamentals	Passed

Higher Education

Degree/Examination	Institute/School	Score	Year
B. Tech (Computer Science and Engineering)	JECRC University, Jaipur	9.15 CGPA	2018-2022
